Response to Arguments

Applicant's arguments filed December 27, 2005 have been fully considered and they are partially persuasive. A discussion is provided below.

Applicant argues: Yi does not disclose at least dividing the encapsulated content into a plurality of pieces with each piece capable of being independently retransmitted, and supplying low level data units containing a plurality of the plurality of pieces" as recited by amended independent claim 1.

Response: Yi discloses per [0014], "To achieve the objects and in accordance with the purposes of the invention, as embodied and broadly described herein, a method of generating PDUs in a radio link control layer includes producing a payload unit by segmenting and/or concatenating one or more service data units received from a higher layer, generating a first PDU which includes a sequence number corresponding to the payload unit and a second PDU which includes the payload unit, and transmitting the first and second PDUs to a lower layer." The segmenting and or / concatenating one or more service data units received from a higher layer meets the claim limitations for "dividing the encapsulated content into a plurality of pieces.

Yi discloses [0005], "Then the TB is transmitted to a physical (PHY) layer through a transport channel, and the PHY layer attaches a cyclic redundancy check

(CRC) to the TB received and lastly transmits it to a receiving system though a physical channel" and per [0029], "Then each TB is attached to a cyclic redundancy check (CRC) in the physical layer for detecting errors and transmitted to the receiving system."

The CRC functions meets the claim limitation for allowing "each piece capable of being independently retransmitted" in the event of an error.

As far as the limitation for "supplying low level data units containing a plurality of the plurality of pieces", examiner directs applicant to claim 1 of Yi which states "1. A method of generating protocol data units (PDU) in a radio link control layer (RLC), the method comprising the steps of: (a) producing a payload unit by segmenting or concatenating one or more service data units received from a higher layer; (b) generating a first PDU which includes a sequence number corresponding to said payload unit and a second PDU which includes said payload unit; and (c) transmitting said first and second PDUs to a lower layer."

Per claim 1 above, "One or more service data units" is interpreted as a "plurality of pieces"

(b) generating a first PDU which includes a sequence number corresponding to said payload unit and a second PDU which includes said payload unit; and (c) transmitting said first and second PDUs to a lower layer" is interpreted as "supplying low level data units containing a plurality"

Thus, "the first and second PDU of the one or more service data units" is interpreted as a "plurality of the plurality of pieces".

Applicant argues: Yi does not disclose "at least adaptively escalating the robustness of transmission of the low level data units depending on the frequency of transmission errors," as recited by independent claim 49.

Response: Applicant's arguments, see remarks to non-final, filed December 27, 2005, with respect to the rejection(s) of claim(s) 49-56 under 35 U.S.C. 102 have been fully considered and are persuasive. Therefore, the rejection has been withdrawn. However, upon further consideration, a new ground(s) of rejection is made in view of Rakib et al. (US2002/0015423) The discussion of the new claims 57-68 is provided below.

Claim Objections

Page 4

Claim 24 is objected to because of the following informalities: Examiner suggests that "(e.g., MSID)" be removed. Appropriate correction is required.

Claim 53 is objected to because of the following informalities: Examiner suggests that "(e.g., segments)" be removed. Appropriate correction is required.

Claim Rejections - 35 USC § 112

The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Application/Control Number: 10/720,742

Art Unit: 2141

Claim 16 is rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

As per claim 16, it is unclear to the meaning of "substantially"

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1-3, 12, 57-60 and 65-67 are rejected under 35 U.S.C. 102(b) as being anticipated by Yi et al. (US 2002/0001314).

As per claims 1 and 57, Yi et al. discloses a method of operating in a network in which a plurality of stations communicate over a shared medium, comprising

providing a physical layer for handling physical communication over the shared medium; ([0025], Figure 4)

providing a high level layer that receives data from the station and supplies high level data units for transmission over the medium; ([0025], Figure 4)

providing a MAC layer that receives the high level data units from the high level layer and supplies low level data units to the physical layer; at the MAC layer, ([0025], Figure 4)

encapsulating content from a plurality of the high level data units; ([0029] lines 3-4)

dividing the encapsulated content into a plurality of pieces with each piece capable of being independently retransmitted; and ([0005], [0014], [0029] line 1-9, Figure 4)

supplying low level data units containing one or more of the plurality of pieces. ([0029], Claim 1)

As per claim 2, Yi et al. discloses the method of claim 1 wherein at least some information common to the encapsulated high level data units is not repeated for each high level data unit encapsulated in a low level data unit. ([0031]; dividing the RLC PDU in a split mode and separately transmitting the part including the SN in a different channel.)

As per claim 3, Yi et al. discloses the method of claim 2 wherein the information common to the encapsulated high level data units comprises destination and source addresses. ([0026] lines 13-23) Destination and source address are inherent to the PDU in order to send the PDU to the destination and send an acknowledgement signal to an originating system.

As per claim 12, Yi discloses the method of claim 1 wherein some of the pieces making up a low-level data unit constitute retransmitted pieces that failed to be correctly transmitted in an earlier attempt. ([0031], inherent to APQ, (hybrid automatic repeat request)

As per claim 58, Yi discloses the method of claim 57 wherein a plurality of the plurality of pieces each include a same number of the sub-blocks. ([0030]; The SN PDU contains a SN and E if the RLC is set to an unacknowledged mode and further contains a D/C, P, and HE field if it is set to an acknowledged mode.)

As per claim 59, Yi discloses the method of claim 59 wherein an amount of padding in a piece is selected based on the number of sub-blocks in the piece and the size of the pieces. ([0030]; The LI+PU PDU has a PAD field in order to maintain its size since the number of the LI and the length of data can vary.)

As per claim 60, Yi discloses the method of claim 59 wherein an amount of padding in a piece is selected based on the number of sub-blocks in the piece and the size of the pieces. ([0030])

As per claim 65, Yi discloses the method of claim 1 wherein at least some of the low level data units contain information that indicates whether a boundary between high

level data units exists within the low level data unit. ([0008],[0027]; The LI forms boundaries between the SDUs if a PDU has more than one SDU and has its size of 7 bits or 15 bits.)

As per claim 66, Yi discloses he method of claim 65 wherein, if such boundary does exist within the low level data unit, the low level data unit further comprises information that indicates where the boundary occurs within the low level data unit.

([0007]-[0008]; Figures 2 + 3; between the RLC SDUs)

As per claim 67, Yi discloses the method of claim 66 wherein the information that indicates whether a boundary between high level data units exists within the low level data unit comprises a field having a value that indicates which piece in the low level data unit includes the boundary, or having a value that indicates that no boundary exists within the low level data unit. ([0027], The E field indicates whether the next field is a data or LI/E field and has a size of one bit)

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 4-8, 17-19, 28-36, 44-46, 61-64 and 68 are rejected under 35 U.S.C. 103(a) as being unpatentable over Yi et al. –hereinafter Yi (US 2002/0001314) in view of Rosengard et al. – hereinafter Rosengard (US 2005/0063402).

As per claims 4 and 61, Yi discloses the method of claim 2, wherein the high level data units each comprise a payload. ([0026]); "RLC SDUs received from a higher layer" is interpreted as the payloads) Yi fails to disclose forming a queue comprising the payloads from a succession of high level data. Rosengard discloses forming a queue comprising the payloads from a succession of high level data. ([0005])At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to forming a queue comprising the payloads from a succession of high level data in the disclosure of Yi. The motivation for doing do would have been so that the number of packets can adaptively be adjusted according to amount of data in the queue, the delay requirements of packets, and the network conditions. ([0005])

As per claims 5 and 62, Yi/ Rosengard discloses the method of claim 4, and Yi discloses wherein the queue comprises a succession of sub-frames, each sub-frame comprising a header and a plurality of payloads. ([0026], the "RLC SDUs received from a higher layer are segmented into a appropriate size set by the radio bearer and/or concatenated to form a RLC payload unit (RLC PU)" The RLC PU is interpreted as sub-frames)

As per claims 6 and 63, Yi / Rosengard discloses the method of claim 5, and Yi discloses wherein each sub-frame is divided into the plurality of pieces capable of being independently retransmitted. ([0026]; "Each PU is then divided into two independent PDUs: a first PDU (SN PDU) including a sequence number (SN) corresponding to the PU and an extension (E) field and the other PDU (LI+PU PDU) including the PU, one or more length indicators (LI), and one ore more extension (E) fields.)

As per claims 7 and 64, Yi/Rosengard discloses the method of claim 6, and Yi discloses wherein division of a sub-frame into the plurality of pieces comprises dividing the sub-frame into a plurality of sub-blocks, and forming at least some pieces from a plurality of sub-blocks. ([0026]; "two independent PDUs" is interpreted as subblocks,)

As per claim 8, Yi/ Rosengard discloses the method of claim 7, and Yi discloses wherein each piece constitutes a segment that is transmitted as a physical layer block. ([0026],Claim 1; generating a first PDU which includes a sequence number corresponding to said payload unit and a second PDU which includes said payload unit; and (c) transmitting said first and second PDUs to a lower layer.)

As per claim 17, Yi/Rosengard discloses the method of claim 5, and Yi discloses further comprising an integrity check value associated with each sub-frame or with a plurality of sub-frames. ([0029] lines 15-20; CRC (Cyclic Redundancy Check)

1)

As per claims 18 and 31, Yi/Rosengard discloses the method of claim 5, and Yi discloses wherein each of the plurality of payloads in a sub-frame have identical length. ([0027]; SN PDU has a fixed length (one or two octets))

As per claim 19, Yi/Rosengard discloses the method of claim 5, and Yi discloses wherein each sub-frame further comprises MAC management information. ([0029], Figure 4)

As per claim 28, Yi/Rosengard discloses the method of claim 5, and Yi discloses wherein the queue is divided into a plurality of sub-blocks, wherein a plurality of sub-blocks are grouped to form a segment, with a segment crossing sub-frame boundaries in the queue, wherein a segment constitutes one of the pieces. ([0026])

As per claim 29, Yi/Rosengard discloses the method of claim 28, and Yi discloses wherein each sub-block is shorter than a sub-frame. ([0026], Claim 1)

As per claim 30, Yi/Rosengard discloses the method of claim 8 or 28, and Yi discloses wherein at least some segments contain a number of sub-blocks corresponding to one or more sub-frames including at least one sub-frame whose associated sub-blocks comprise less than the whole sub-frame. ([0026], [0029], Claim

As per claim 32, Yi / Rosengard discloses the method of claim 28, and Yi discloses wherein the sub-blocks have an associated sequential numbering adapted for use at the receiving station for re-establishing the correct sequential order of the sub-blocks. ([0026], sequence number)

As per claim 33, Yi et al. discloses the method of claim 32 wherein the subblocks have a predetermined size, which combined with the associated sequential numbering, eliminates the need for buffer reordering when out of order segments are received; ([0026], sequence number, [0027]; SN PDU has a fixed length (one or two octets))

As per claim 34, Yi/Rosengard discloses the method of claim 33, and Yi discloses wherein the sub-blocks are of equal size. ([0030], Figures 5 and 6)

As per claim 35, Yi/Rosengard discloses the method of claim 8 or 28, and Yi discloses further comprising, for at least some of the low level data units, forming the low level data unit from a plurality of segments. ([0026], [0029], Figure 4)

As per claim 36, Yi/ Rosengard discloses the method of claim 35, and Yi discloses wherein each segment in the low level data unit forms the body of a separate block transmitted by the physical layer. ([0026], [0029], Figure 4)

Application/Control Number: 10/720,742

Art Unit: 2141

As per claim 44, Yi/Rosengard discloses the method of claim 36, and Yi discloses wherein most of the blocks are identical in length. ([0027])

As per claim 45, Yi/Rosengard discloses the method of claim 44, and Yi discloses wherein the initial and final block of a low level data unit can be of a different length than the remaining blocks. ([0030]; The LI+PU PDU has a PAD field in order to maintain its size since the number of the LI and the length of data can vary.)

As per claim 46, Yi/Rosengard discloses the method of claim 35 and Yi discloses wherein information common to the plurality of segments forming the low level data unit is transmitted in a header for the low level data unit. ([0029], Figure 4)

Claims 9-11, 49-56 and 68 are rejected under 35 U.S.C. 103(a) as being unpatentable over Yi et al. – hereinafter Yi (US 2002/0001314) in view of Rakib et al. – hereinafter Rakib (US 2002/0015423)

As per claims 9 and 55, Yi discloses the method of claim 1. Yi fails to discloses ARQ, however fails to disclose recovering one or more lost pieces at the destination without having to retransmit the lost pieces. Rakib discloses parity pieces derived from other pieces and capable of being used at a destination to recover one or more lost pieces at the destination without having to retransmit the lost pieces. ([0386]) At the

time the invention was made, it would have been obvious to a person of ordinary skill in the art to disclose recovering one or more lost pieces at the destination without having to retransmit the lost pieces in the disclosure of Yi. The motivation for doing do would have been to reduce the error rate or increase the number of payload bits without increasing the symbol rate and bandwidth consumed. ([0281])

As per claim 10, Yi / Rakib discloses the method of claim 9 wherein each piece is transmitted as a physical layer block, and Yi discloses the parity pieces are also transmitted as parity physical layer blocks. ([0029])

As per claim 11, Yi/ Rakib discloses the method of claim 10 wherein the physical layer blocks are encoded. ([0029]) Yi fails to disclose forward error correction. Rakib discloses forward error correction. ([0031]) At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to disclose forward error correction in the disclosure of Yi. The motivation for doing do would have been to effectively manage the noise using conventional error detection and correction bits. ([0027])

As per claims 49, Yi discloses the same limitations as recited in claim 1.

However, Yi fails to disclose adaptively escalating the robustness of transmission of the low level data units depending on the frequency of transmission errors. Rakib discloses adaptively escalating the robustness of transmission of the low level data units

depending on the frequency of transmission errors. ([0381]) At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to disclose adaptively escalating the robustness of transmission of the low level data units depending on the frequency of transmission errors. The motivation for doing do would have been to reduce noise power ([0381])

As per claim 50, Yi/ Rakib disclose the method of claim 49. Yi fails to disclose incorporating forward error correction and adaptive varying forward error corrections. Rakib discloses wherein the method further comprises the method further comprises incorporating forward-error correction information into the transmitted stream of low level data units. ([0031]) At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to disclose forward error correction in the disclosure of Yi. The motivation for doing do would have been to effectively manage the noise using conventional error detection and correction bits. The discussion of adaptively varying forward error correction is included in claim 49 above, from which this claim depends on.

As per claim 51, Yi et al. discloses the method of claim 41. Yi fails to discloses wherein the level of forward error correction used is different for different blocks. Rakib discloses wherein the level of forward error correction used is different for different blocks. ([0381]) At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to disclose wherein the level of forward

error correction used is different for different blocks in the disclosure of Yi. The motivation for doing do would have been to reduce noise power ([0381])

As per claim 52, Yi / Rakib disclose the method of claim 49. Yi fails to disclose wherein decisions on adaptively escalating are made at transmitting station. Rakib discloses wherein decisions on adaptively escalating are made at a transmitting station. ([0016], a central unit transmitter with any encoder to receive downstream data, encode it and drive any type of digital passband modulator with the encoder receiving a master clock signal from a master clock oscillator and the modulator receiving a master carrier oscillator; ([0381]), fallback mode is implemented by a mode control signal on line 530 in FIG. 32 to the encoder, the encoder is interpreted as the transmitter). At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to decisions on adaptively escalating are made at a transmitting station in the disclosure of Yi. The motivation for doing do would have been to reduce the amount of payload in each symbol and add more redundancy. ([0381])

As per claim 53, Yi / Rakib disclose the method of claim 50, and Yi discloses wherein the low level data units comprise a plurality of pieces. (e.g., segments). ([0005], [0014], [0029] line 1-9, Figure 4)

As per claim 54, Yi / Rakib disclose the method of claim 52, and Yi discloses wherein the forward error correction information comprises information associated with

provided with the pieces for use at a destination for recovering a piece that is received with errors. ([0029] lines 15-20; CRC (Cyclic Redundancy Check)

As per claim 56, Yi / Rakib disclose the method of claim 55, and Yi discloses wherein each piece is transmitted as a physical layer block, and the parity pieces are also transmitted as parity physical layer blocks. ([0029] lines 15-20; CRC (Cyclic Redundancy Check)

As per claim 68, Yi discloses the method of claim 67. Yi fails to disclose an offset indicating a relative position of the boundary within the piece including the boundary. Rakib discloses wherein the information that indicates where the boundary occurs within the low level data unit comprises an offset indicating a relative position of the boundary within the piece including the boundary. ([0194]) At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to disclose an offset in the disclosure of Yi. The motivation for doing do would have been to achieve frame synchronization. ([0615])

Claims 14-16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Yi (US 2002/0001314) / Rosengard (US 2005/0063402) in view of Gibson et al. – hereinafter Gibson (US 6,445,717)

As per claim 14, Yi/Rosengard discloses the method of claim 5. Yi fails to disclose delivery time stamp. Gibson discloses wherein each sub-frame further comprises a delivery time stamp associated with at least some payloads. (Col 6 line 54 – Col 7 line 5) At the time of invention, it would have been obvious to a person of ordinary skill in the art to use time stamp in the disclosure of Yi. The motivation for doing so would have been to calculate a round trip time. (Col 6 line 54 – Col 7 line 5)

As per claim 15, Yi/Rosengard discloses the method of claim 5. Yi fails to disclose wherein clock information characterizing the time setting of a clock in a transmitting station is transmitted to a receiving station within a header of the low level data units. Gibson discloses the clock information is used by the receiving station along with the delivery time stamps to establish the time at which payloads are delivered. (Col 6 line 54 – Col 7 line 5) At the time of invention, it would have been obvious to a person of ordinary skill in the art to disclose clock information in the disclosure of Yi. The motivation for doing so would have been to detect packet loss if expected packets don't arrive in the allowed time. (Col 9 lines 1-23)

As per claim 16, Yi/ Rosengard disclose the method of claim 15. Yi fails to disclose the time a payload is delivered is set by time stamp. Gibson discloses wherein the time at which a payload is delivered is set to be substantially the time specified by the time stamp. (Col 6 line 54 – Col 7 line 5. At the time of invention, it would have been obvious to a person of ordinary skill in the art to disclose the time a payload is

delivered is set by time stamp in the disclosure of Yi. The motivation for doing so would have been to detect packet loss if expected packets don't arrive in the allowed time.

(Col 9 lines 1-23)

Claim 20-27 are rejected under 35 U.S.C. 103(a) as being unpatentable over Yi (US 2002/0001314) / Rosengard (US 2005/0063402) in view of Del Prado Pavon et al. – hereinafter Del Prado Pavon (2004/0047351)

As per claims 20 and 21, Yi/Rosengard discloses the method of claim 4, and Yi discloses wherein the MAC layer has the capability of transmitting data in a plurality of sessions, wherein a station to which data is transmitted is identified by a destination address and a station from which data is transmitted is identified by a source address, ([0026], [0029], Figure 4) Yi fails to disclose within a regularly-repeated contention free interval, and wherein the queue contains payloads for the same session, same source address, and same destination address. Rosengard discloses a queue as mentioned in the limitations of claim 4. Yi fails to disclose transmitting data in a contention-free interval. Lee discloses transmitting data in a contention free interval. Del Prado Pavon discloses contention-free interval. ([0043]; CSMA/CA - Carrier Sense Multiple Access with Collision Avoidance) At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to disclose contention free interval in the disclosure of Yi. The motivation for doing do would have been to differentiate channel access to frames of different priorities as labeled by a higher layer ([0043])

As per claim 22, Yi/ Rosengard/ Del Prado Pavon discloses the method of claim 20 or 21, and Yi discloses wherein the MAC layer processes data transmitted in the sessions. ([0029]) The discussion for contention free channel access processing is disclosed in claims 20 and 21 above.

As per claim 23, Yi/ Rosengard/ Del Prado Pavon discloses the method of claim 22. Yi fails to disclose time slots. Rosengard discloses wherein the sessions are transmitted within time slots of a regularly-repeated contention-free interval. ([0004]; Each packet is associated with a delay requirement that reflects a deadline corresponding to real-time traffic of at least one of the stations. At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to disclose time slots in the disclosure of Yi. The motivation for doing do would have been so that the number of packets can adaptively be adjusted according to amount of data in the queue, the delay requirements of packets, and the network conditions. ([0005])

As per claim 24, Yi/ Rosengard/ Del Prado Pavon discloses the method of claim 20 or 21. Yi fails to disclose a stream identifier. Rosengard discloses stream identifier wherein a stream identifier (e.g., MSID) is used to associate content of a queue with a particular session. ([0051],[0052]) At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to disclose a stream identifier in the disclosure of Yi. The motivation for doing do would have been to determine the

number of packets that may be encapsulated to form a frame of a suitable size or calculate whether waiting for a next packet would lead to a violation of a delay requirement. ([0052])

As per claim 25, Yi/Rosengard/Del Prado Pavon discloses the method of claim 24. Yi fails to disclose priority level. Del Prado Pavon discloses wherein the stream identifier is also used to associate content of a queue with a priority level for contention-based transmission over the medium. ([0043]) At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to disclose priority level in the disclosure of Yi. The motivation for doing do would have been to have multiple queues that work independently, in parallel, for different priorities. ([0043])

As per claims 26 and 27, Yi/Rosengard/Del Prado Pavon discloses the method of claim 24. Yi fails to disclose stream identifier and a plurality of queues. Rosengard discloses stream identifiers and a plurality of queues. (([0004][0051-0052], [0063]) At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to disclose stream identifiers and a plurality of queues in the disclosure of Yi. The motivation for doing do would have been to form a frame of a suitable size or calculate whether waiting for a next packet would lead to a violation of a delay requirement. ([0051])

Claims 37 is rejected under 35 U.S.C. 103(a) as being unpatentable over Yi (US 2002/0001314) / Rosengard (US 2005/0063402) in view of Jiang et al. – hereinafter Jiang (US 6,765,885).

As per claim 37, Yi / Rosengard discloses the method of claim 35 and individual segments. Yi fails to disclose encryption. Jiang discloses wherein individual segments are individually encrypted. (Col 3 lines 58-67) At the time of invention, it would have been obvious to a person of ordinary skill in the art to use encryption in the disclosure of Yi et al. The motivation for doing so would have been to allow for security (Col 3 lines 58-67)

Claims 38-40 are rejected under 35 U.S.C. 103(a) as being unpatentable over Yi (US 2002/0001314) / Rosengard (US 2005/0063402) / Jiang (US 6,765,885) further in view of Henson et al. – hereinafter Henson (US 2002/0131591)

As per claim 38, Yi/ Rosengard / Jiang discloses the method of claim 37. Yi fails to discloses encryption is carried in a header. Henson discloses encryption information common to a plurality of segments is carried in a header. [0108]. At the time of invention, it would have been obvious to a person of ordinary skill in the art to use encryption in a header in the disclosure of Yi et al. The motivation would have been to prevent unauthorized user from accessing body of the message or the segments. ([0108])

Application/Control Number: 10/720,742 Page 23

Art Unit: 2141

As per claims 39 and 40, Yi/ Rosengard / Jiang discloses the method of claim 37. Yi fails to discloses wherein encryption information common to a plurality of segments is carried in a header. Henson et al. discloses wherein some encryption information is carried in a header and frame control of the low level data unit and in a header of the block. [0108] At the time of invention, it would have been obvious to a person of ordinary skill in the art to use encryption in a header and frame control in the disclosure of Yi. The motivation would have been to prevent unauthorized user from accessing body of the message or the segments. ([0108])

Claims 13, 41-43 and 47-48 are rejected under 35 U.S.C. 103(a) as being unpatentable over Yi et al. – hereinafter Yi (US 2002/0001314) / Rosengard (US 2005/0063402)in view of Rakib et al. –hereinafter Rakib (US 2002/0015423)

As per claim 13, Yi / Rosengard discloses the method of claim 12. Yi fails to disclose wherein at least some retransmitted pieces are transmitted with greater forward error correction. Rakib discloses wherein at least some retransmitted pieces are transmitted with greater forward error correction. ([0381]; fallback mode where more redundant bits are added to each 4-bit group and correspondingly less payload data in included in each 4 bit group) At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to retransmit pieces are transmitted with

greater forward error correction in the disclosure of Yi. The motivation for doing do would have been to reduce noise power ([0381])

As per claim 41, Yi/ Rosengard discloses the method of claim 36 and Yi fails to disclose forward error correction. Rakib discloses wherein each block separately undergoes forward error correction, and forward error correction bits for each block are transmitted in the low level data unit. ([0031]) At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to disclose forward error correction and each block separately undergoes forward error correctionin the disclosure of Yi. The motivation for doing do would have been to effectively manage the noise using conventional error detection and correction bits. ([0027])

As per claim 42, Yi/Rosengard/Rakib discloses the method of claim 41. Yi fails to discloses wherein the level of forward error correction used is different for different blocks. Rakib discloses wherein the level of forward error correction used is different for different blocks. ([0381]) At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to disclose wherein the level of forward error correction used is different for different blocks in the disclosure of Yi. The motivation for doing do would have been to reduce noise power ([0381])

As per claim 43, Yi/Rosengard/Rakib discloses the method of claim 42. Yi fails to discloses wherein the level of forward error correction used provides greater error

Application/Control Number: 10/720,742 Page 25

Art Unit: 2141

correction capability for selected blocks that are being retransmitted after failing to be correctly transmitted in an earlier attempt. Rakib discloses wherein the level of forward error correction used provides greater error correction capability for selected blocks that are being retransmitted after failing to be correctly transmitted in an earlier attempt. ([0381]) At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to disclose wherein the level of forward error correction used provides greater error correction capability for selected blocks that are being retransmitted after failing to be correctly transmitted in an earlier attempt in the disclosure of Yi. The motivation for doing do would have been to reduce noise power ([0381])

As per claim 47, Yi/Rosengard/Rakib discloses the method of claim 41 and Yi wherein the information common to the plurality of segments is transmitted only in the header. ([0029], Figure 4)

As per claim 48, Yi/ Rosengard/ Rakib discloses the method of claim 41 and Yi discloses wherein the low level data unit further comprises a frame control field.

([0007], Figure 3; data/control (D/C))

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Chirag R. Patel whose telephone number is (571)272-7966. The examiner can normally be reached on Monday to Friday from 7:30AM to 4:00PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Rupal Dharia, can be reached on (571) 272-3880. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pairdirect.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll free).
